RESEARCH OVERVIEW	Over the course from my undergraduate to Ph.D., I have focused on mobile systems and automation.	
	▪ Gesto is a system that enables task automation for Android apps using gestures and voice commands. Using our system, a user can record a UI action sequence for an app, choose a gesture or a voice command to activate the UI action sequence, and later trigger the UI action sequence by the corresponding gesture/voice command.	
	▪ Reptor enables open innovation in mobile platforms. Our technique allows third-party developers to modify, instrument, or extend platform API calls and deploy their modifications seamlessly. The uniqueness of our technique is that it enables modifications completely at the app layer without requiring any platform-level changes.	
	▪ Mimic is an automated UI compatibility testing system for Android apps. Mimic is designed specifically for comparing the UI behavior of an app across different devices, different Android versions, and different app versions.
